

Gabriel Eduardo da Silva Rosa

Scalable Systems Architect | Event-Driven Platforms | Platform Engineering

📍 Jaraguá do Sul, Brazil (UTC-3) | Open to remote, hybrid, on-site and relocation

✉ gabriel.edu.rosa@proton.me | 🌐 rosa-gabriel.github.io | 🐙 github.com/rosa-gabriel | 🌐 linkedin.com/in/gabriel-edu-rosa

Summary

Systems architect with 4 years building event-driven and internal developer platforms at WEG. Saved R\$12M (BRL) by modernizing authentication, cut data sync delay from 1 day to 200 ms, and built platforms serving 1,000+ developers and 600+ databases.

Skills

Languages & Frameworks: Java, Go, Rust, TypeScript, JavaScript, Quarkus, NestJS

Streaming & Data: Apache Kafka, Kafka Connect, Apache Flink, RabbitMQ, Databricks, Qlik Replicate, PostgreSQL, MongoDB, Oracle, Redis, MinIO

Cloud & Platform: Kubernetes, AWS, Kong, Keycloak, OpenID Connect, OpenTelemetry, Grafana, CI/CD, SAP Business Suite

Architecture: Event-Driven Architecture, Domain-Driven Design, API Governance, Distributed Systems, Parallel Computing

Work Experience

WEG, Jaraguá do Sul, Brazil

Sep 2025 - Present

Scalable Systems Architect

Contract, Hybrid

- Leading the architecture of an on-premise event streaming platform (Kafka, RabbitMQ, Flink) that lets teams across the organization build decoupled, self-service integrations through a central event bus.
- Built automated provisioning of connectors for databases and external systems, making integration with the central event bus a self-service step.
- Implemented real-time data processing, transformation and enrichment with Apache Flink, enabling streaming analytics on enterprise data.
- Designed a hybrid architecture (on-premise and AWS) with cross-cluster replication for multi-environment availability.
- Leading a low-code platform for real-time integrations that abstracts event-driven complexity for teams without streaming expertise.
- Java, Quarkus, Apache Kafka, Kafka Connect, Apache Flink, RabbitMQ, Kubernetes, AWS

WEG, Jaraguá do Sul, Brazil

Feb 2023 - Aug 2025

Software Architecture Researcher

Systems Architecture and Data Governance

- Led the replacement of WEG's authentication stack, standardizing user and system-to-system auth on OpenID Connect and Keycloak, saving R\$12M (BRL) in costs in a single project.
- Cut data synchronization delay from 1 day to 200 ms by replacing cron-based batch jobs with an event-driven architecture.
- Designed Developers Suite, an internal developer platform for API and system governance that now manages and guides 1,000+ developers, standardizing integration patterns across teams.
- Built a self-service platform for provisioning databases and Kubernetes environments, now managing 600+ databases (PostgreSQL, MongoDB, Redis, MinIO) and cutting provisioning time.
- Architected a centralized API gateway with Kong on Kubernetes and evolved it into a micro-gateway architecture across on-premise and cloud, reducing duplicated integration logic.
- Implemented OpenTelemetry observability (logs, metrics and traces in Grafana) and reproducible CI/CD pipelines for automated Kubernetes deployments.
- TypeScript, Kubernetes, Kong, Keycloak, OpenID Connect, OpenTelemetry, Grafana, PostgreSQL, MongoDB, Redis, MinIO

Education

Universidade do Estado de Santa Catarina (UDESC)

Mar 2026 - Dec 2028 (expected)

M.Sc. in Applied Computer Science, Advanced Parallel Programming

Parallel and distributed computing, HPC

Católica de Santa Catarina

Mar 2022 - Dec 2025

Bachelor's Degree in Software Engineering

Research scholarship with WEG

Project Work

- **Oxid Gateway (2025, bachelor's thesis):** Designed and built a high-performance API gateway in Rust, inspired by the API gateway rollout at WEG, exploring modern proxy architecture and low-level performance optimizations. Rust.

Languages and Certificates

- **English:** C1, University of Michigan English Proficiency (score 73, Nov 2020) | **Portuguese:** Native
